RECOMMENDED VARIETIES FOR MILLING OATS

U.S. Midwest

The map provided is designed as a tool to help identify where different oat genetics perform best. The zones outlined are not meant to serve as a rule but a guide to selecting varieties. Please contact Grain Millers if any questions or concerns arise.

R - Resistant  
MR - Moderately Resistant  
MS - Moderately Susceptible  
S - Susceptible

At the time of publication, it is believed that the varieties listed above, combined with good agronomic characteristics and management, should provide the best opportunity for growers to produce food-quality oats. Before purchasing or planting oat varieties not listed, please contact Grain Millers to discuss attributes of other varieties considered.

Grain Millers recommends the frequent scouting of oats fields for both insects and plant diseases from early in the growing season through heading. If leaf fungal diseases are seen, the timely application of registered and approved fungicides for non-organically grown oats is approved and recommended to enhance both yield and grain quality potential. Contact Grain Millers for more information.

Please contact Crop Improvement Associations or Grain Millers for descriptions or more information on varieties.
